Assignment 2 – PS13 - Bayesian Network - [Weightage 13%]

Read through this entire document very carefully before you start!

Problem Statement

A healthcare organization is developing an intelligent medical diagnosis assistant to support doctors in identifying infectious diseases based on observed symptoms and patient history. The system should model probabilistic dependencies between diseases, symptoms, laboratory findings, and environmental factors using a Bayesian Network.

The intelligent agent must reason under uncertainty and dynamically infer the probability of diseases when partial evidence is available. The network should support probabilistic queries such as conditional probability estimation, independence checking, and posterior probability computation.

Each node in the Bayesian Network represents a medical variable such as disease condition, symptom, laboratory result, or patient exposure factor. Directed edges represent probabilistic causal relationships among these variables.

Use Bayesian inference principles and conditional probability computations to determine the likelihood of diseases under varying symptom observations.

Task A: PEAS Description

Explain the PEAS (Performance Measure, Environment, Actuators, Sensors) model for the intelligent medical diagnosis agent. The explanation must be contextualized to healthcare diagnosis and should not be a generic PEAS definition.

Task B: Bayesian Network Implementation

Implement the Bayesian Network using Python and perform probabilistic inference for the following scenarios.

General modelling assumption

All variables in this assignment are binary variables with values True and False.

Use the stated conditional independence assumptions to construct the required joint probability distribution. The implementation must use a reusable inference method based on joint enumeration or equivalent exact inference, rather than only hard-coded formulas for each query.

Scenario 1 – Flu Diagnosis Network**Network Structure**

- Flu (F) directly influences Cough (C) and Fever (V).
- Directed edges: $F \rightarrow C$ and $F \rightarrow V$.
- There is no direct edge between Cough and Fever. Therefore, C and V are assumed to be conditionally independent given F.
- Because C and V share the hidden common cause Flu, they are not marginally independent in general.
- Use the factorization: $P(F, C, V) = P(F) \times P(C | F) \times P(V | F)$.

Variables	Given Probabilities	Required Computations
Flu (F) Cough (C) Fever (V)	$P(F) = 0.10$ $P(C F) = 0.80$ $P(C \neg F) = 0.30$ $P(V F) = 0.70$ $P(V \neg F) = 0.20$	Construct the complete joint probability table. Compute $P(F C)$. Compute $P(F V)$. Compute $P(F C \wedge V)$. Determine whether C and V are independent without evidence. Check whether C and V are conditionally independent given F.

Scenario 2 – Critical Ward Alert System

A hospital monitors whether a patient is in a critical condition using two independent alert systems. EmergencyCondition influences Alert1 and Alert2.

Independence clarification

Alert1 and Alert2 are two separate alert channels, but they are not marginally independent because both are influenced by the same hidden cause, EmergencyCondition.

They are conditionally independent given EmergencyCondition.

- Directed edges: $E \rightarrow A1$ and $E \rightarrow A2$.
- Use the factorization: $P(E, A1, A2) = P(E) \times P(A1 | E) \times P(A2 | E)$.

Variables	Probabilities	Required Computations
EmergencyCondition (E) Alert 1 (A1) Alert 2 (A2)	$P(E) = 0.05$ $P(A1 E) = 0.90$ $P(A1 \neg E) = 0.10$ $P(A2 E) = 0.85$ $P(A2 \neg E) = 0.15$	Compute $P(E A1)$. Compute $P(E A2)$. Compute $P(E A1 \wedge A2)$. Analyze whether A1 and A2 are independent without evidence and conditionally independent given EmergencyCondition.

Task C: Comparative Analysis

Compare the Bayesian Network approach with a deterministic rule-based diagnosis approach. The analysis should discuss:

- Difference between probabilistic reasoning and fixed IF–THEN rule-based reasoning.
- How Bayesian Networks handle uncertain, incomplete, or overlapping symptoms.
- Impact of conditional dependencies on inference accuracy.
- Effect of evidence propagation on posterior probabilities.
- Role of conditional independence and d-separation in reducing computational complexity.

Sample Input

```
PS13
SCENARIO_1_FLU
P_F=0.10
P_C_given_F=0.80
P_C_given_notF=0.30
P_V_given_F=0.70
P_V_given_notF=0.20
SCENARIO_2_CRITICAL_WARD
P_E=0.05
P_A1_given_E=0.90
P_A1_given_notE=0.10
P_A2_given_E=0.85
P_A2_given_notE=0.15
```

Note that the input/output data shown here is only for understanding and testing, the actual file used for evaluation will be different.

Sample Output

```
Scenario 1 - Joint probability table
F C V Probability
T T T 0.0560
T T F 0.0240
T F T 0.0140
T F F 0.0060
F T T 0.0540
F T F 0.2160
F F T 0.1260
F F F 0.5040
Scenario 1: Flu Diagnosis Network
P(F | C) = 0.2286
P(F | V) = 0.2800
P(F | C and V) = 0.5091
C and V are not independent without evidence.

C and V are conditionally independent given F.
Scenario 2: Critical Ward Alert System
P(E | A1) = 0.3214
P(E | A2) = 0.2297
P(E | A1 and A2) = 0.7286
A1 and A2 are not independent without evidence.
A1 and A2 are conditionally independent given EmergencyCondition.
```

Sample test validation

The sample output is mathematically correct under the Bayesian Network structures stated above.

The sample represents a happy-path test case. Students should additionally test missing keys, duplicate keys, invalid probability values, malformed input lines, and invalid scenario identifiers.

Note that the input/output data shown here is only for understanding and testing, the actual file used for evaluation will be different.

Display the output in outputPSXX.txt.

Deliverables:

- PDF document **designPSXX_<group id>.pdf** detailing your solution.
- **[Group id] _Contribution.xlsx** mentioning the contribution of each student in terms of percentage of work done. Columns must be “Student Registration Number”, “Name”,

“Percentage of contribution out of 100%”. If a student did not contribute at all, it will be 0%, if all contributed then 100% for all.

- **inputPSXX.txt** file used for testing
- **outputPSXX.txt** file generated while testing
- .py file containing the python code. Do not fragment your code into multiple files
- Zip all of the above files including the design document in a folder with the name:
 - **[Group id] _A2_PSXX.zip** and submit the zipped file.
 - Group Id should be given as **Gxxx** where **xxx** is your group number. For example, if your group is 26, then you will enter **G026** as your group id.

Instructions:

- It is compulsory to make use of the data structure(s) / algorithms mentioned in the problem statement.
- Ensure that all data structure insert and delete operations throw appropriate messages when their capacity is empty or full. Also ensure basic error handling is implemented.
- For the purposes of testing, you may implement some functions to print the data structures or other test data. But all such functions must be commented before submission.
- Make sure that your read, understand, and follow all the instructions
- Ensure that the input, prompt and output file guidelines are adhered to. Deviations from the mentioned formats will not be entertained.
- The input, prompt and output samples shown here are only a representation of the syntax to be used. Actual files used to evaluate the submissions will be different. Hence, do not hard code any values into the code.
- Please note that the design document must include:
 - One alternate way of modeling the problem with the performance implications.
 - Writing a good technical report and well documented code is an art. Your report cannot exceed 4 pages. Your code must be modular and quite well documented.
 - You may ask queries [in this dedicated discussion section](#). Beware that only hints will be provided and queries asked **in other channels like MS Teams, emails, Taxila inbox will not be responded to.**

Deadline

- The strict deadline for submission of the assignment is **17th Aug 2026 11:55 PM IST (Monday)**.
- The deadline has been set considering extra days from the regular duration in order to accommodate any challenges you might face. No further extensions will be entertained.
- Late submissions will be evaluated as below. Submissions made between:
 - 17th Aug 2026 11:56PM to 18th Aug 2026 11:55PM → Deduct 2M for late

submission and evaluation for 10 marks.

- 18th Aug 2026 11:56PM to 19th June 2026 11:55PM → Deduct 6M for late submission and evaluation for 6marks.
- Beyond 19th Aug 2026 11:55PM → No evaluations, 0 marks will be awarded.

How to submit

- This is a group assignment.
- Each group has to make one submission (only one, no resubmission) of solutions.
- Each group should zip all the deliverables in one zip file and name the zipped file as [Group id] _A2_PSXX.zip and submit the zipped file.
- Group Id should be given as Gxxx where xxx is your group number. For example, if your group is 26, then you will enter G026 as your group id.
- Assignments should be submitted via Taxila > Assignment section. Assignments submitted via other means like email etc. will not be graded.

Evaluation

- The assignment carries **13 Marks**.
- Grading will depend on:
- Fully executable code with all functionality working as expected
 - Well-structured and commented code
 - Accuracy of the design document.
 - Every bug in the functionality will have negative marking.
 - Marks will be deducted if your program fails to read the input file used for evaluation due to change / deviation from the required syntax.
- We encourage students to take the upcoming assignments and examinations seriously and submit only original work. Please note that plagiarism in assignments will be taken seriously. Refer to the detailed policy [here](#).
- Source code files which contain compilation errors will get at most 25% of the value of that question.
